GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

## Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion

of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based

on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such

parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then

the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF

MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>

Copyright (C) <year>  <name of author>

This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; either version 2 of the License, or
(at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License along
with this program; if not, write to the Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this
when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate
parts of the General Public License.  Of course, the commands you use may
be called something other than `show w' and `show c'; they could even be

mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License.

This file is a contribution to the lwIP TCP/IP stack. The Swedish Institute of Computer Science and Adam Dunkels are specifically granted permission to redistribute this source code. Author: Leon Woestenberg <leon.woestenberg@gmx.net> This is a DHCP client for the lwIP TCP/IP stack. It aims to conform with RFC 2131 and RFC 2132. TODO:
- Support for interfaces other than Ethernet (SLIP, PPP, ...) Please coordinate changes and requests with Leon Woestenberg <leon.woestenberg@gmx.net> Integration with your code: In lwip/dhcp.h define DHCP_COARSE_TIMER_SECS (recommended 60 which is a minute) define DHCP_FINE_TIMER_MSECS (recommended 500 which equals TCP coarse timer) Then have your application call dhcp_coarse_tmr() and dhcp_fine_tmr() on the defined intervals. dhcp_start(struct netif netif); starts a DHCP client instance which configures the interface by obtaining an IP address lease and maintaining it. Use dhcp_release(netif) to end the lease and use dhcp_stop(netif) to remove the DHCP client. /

DNS.C The lwIP DNS resolver functions are used to lookup a host name and map it to a numerical IP address. It maintains a list of resolved hostnames that can be queried with the dns_lookup() function. New hostnames can be resolved using the dns_query() function. The lwIP version of the resolver also adds a non-blocking version of gethostbyname() that will work with a raw API application. This

function checks for an IP address string first and converts it if it is valid. gethostbyname() then does a dns_lookup() to see if the name is already in the table. If so, the IP is returned. If not, a query is issued and the function returns with a ERR_INPROGRESS status. The app using the dns client must then go into a waiting state. Once a hostname has been resolved (or found to be non-existent), the resolver code calls a specified callback function (which must be implemented by the module that uses the resolver). / RFC 1035 - Domain names - implementation and specification RFC 2181 - Clarifications to the DNS Specification

@file Packet buffer management Packets are built from the pbuf data structure. It supports dynamic memory allocation for packet contents or can reference externally managed packet contents both in RAM and ROM. Quick allocation for incoming packets is provided through pools with fixed sized pbufs. A packet may span over multiple pbufs, chained as a singly linked list. This is called a "pbuf chain". Multiple packets may be queued, also using this singly linked list. This is called a "packet queue". So, a packet queue consists of one or more pbuf chains, each of which consist of one or more pbufs. CURRENTLY, PACKET QUEUES ARE NOT SUPPORTED!!! Use helper structs to queue multiple packets. The differences between a pbuf chain and a packet queue are very precise but subtle. The last pbuf of a packet has a ->tot_len field that equals the ->len field. It can be found by traversing the list. If the last pbuf of a packet has a ->next

field other than NULL, more packets are on the queue. Therefore, looping through a pbuf of a single packet, has an loop end condition (tot_len p->len), NOT (next NULL). / Copyright (c) 2001-2004 Swedish Institute of Computer Science. OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE. Author: Dominik Spies <kontakt@dspies.de> This is a AutoIP implementation for the lwIP TCP/IP stack. It aims to conform with RFC 3927. Please coordinate changes and requests with Dominik Spies <kontakt@dspies.de> / USAGE: define LWIP_AUTOIP 1 in your lwipopts.h If you don't use tcpip.c (so, don't call, you don't call tcpip_init): - First, call autoip_init(). - call autoip_tmr() all AUTOIP_TMR_INTERVAL msces, that should be defined in autoip.h. I recommend a value of 100. The value must divide 1000 with a remainder almost 0. Possible values are 1000, 500, 333, 250, 200, 166, 142, 125, 111, 100 .... Without DHCP: - Call autoip_start() after netif_add(). With DHCP: - define LWIP_DHCP_AUTOIP_COOP 1 in your lwipopts.h. - Configure your DHCP Client. /

This file is a contribution to the lwIP TCP/IP stack. The Swedish Institute of Computer Science and Adam Dunkels are specifically granted permission to redistribute this source code. Note 1) Although the rfc requires V1 AND V2 capability we will only support v2 since now V1 is very old (August 1989) V1 can be added if required a debug print and statistic have been implemented to show this up. Note 2) A query for a specific group address (as opposed to ALLHOSTS) has now been implemented as I am unsure if it is required a debug print and statistic have been implemented to show this up. Note 3) The router alert rfc 2113 is implemented in outgoing packets but not checked rigorously incoming Steve Reynolds RFC 988 - Host extensions for IP multicasting - V0 RFC 1054 - Host extensions for IP

multicasting RFC 1112 - Host extensions for IP multicasting - V1 RFC 2236 - Internet Group Management Protocol, Version 2 - V2 <- this code is based on this RFC (it's the "de facto" standard) RFC 3376 - Internet Group Management Protocol, Version 3 - V3 RFC 4604 - Using Internet Group Management Protocol Version 3... - V3+ RFC 2113 - IP Router Alert Option

@file SNMP output message processing (RFC1157). Output responses and traps are build in two passes: Pass 0: iterate over the output message backwards to determine encoding lengths Pass 1: the actual forward encoding of internal form into ASN1 The single-pass encoding method described by Comer & Stevens requires extra buffer space and copying for reversal of the packet. The buffer requirement can be prohibitively large for big payloads (> 484) therefore we use the two encoding passes. / Copyright (c) 2006 Axon Digital Design B.V., The Netherlands. @file Address Resolution Protocol module for IP over Ethernet Functionally, ARP is divided into two parts. The first maps an IP address to a physical address when sending a packet, and the second part answers requests from other machines for our physical address. This implementation complies with RFC 826 (Ethernet ARP). It supports Gratuitious ARP from RFC3220 (IP Mobility Support for IPv4) section 4.6 if an interface calls etharp_gratuitous(our_netif) upon address change. / Copyright (c) 2001-2003 Swedish Institute of Computer Science. Timer initializations are removed. All unnecessary include files and hash defines are removed. 03/01/2013: Timer initialization is added back. Support for SI 692601 is added in the timer callback. The SI 692601 refers to the following issue. The EmacPs has a HW bug on the Rx path for heavy Rx traffic. Under heavy Rx traffic because of the HW bug there are times when the Rx path becomes unresponsive. The workaround for it is to check for the Rx path for traffic (by reading the stats registers regularly). If the stats register does not increment for sometime (proving no Rx traffic), the function resets the Rx data path. </pre> /

Use of RAW API implies that the webserver is blazingly fast, but the design is not obvious since a lot of the work happens in asynchronous callback functions. The webserver works as follows: - on every accepted connection, only 1 read is performed to identify the file requested. Further reads are avoided by sending a "Connection: close" in the HTTP response header - the read determines what file needs to be set (by parsing "GET / HTTP/1.1" request - once the file to be sent is determined, tcp_write is called

in chunks of size tcp_sndbuf() until the whole file is sent /

This file is part of the lwIP TCP/IP stack. / This file xemacpsif_physpeed.c implements functionalities to: - Detect the available PHYs connected to a MAC - Negotiate speed - Configure speed - Configure the SLCR registers for the negotiated speed In a typical use case, users of the APIs implemented in this file need to do the following. - Call the API detect_phy. It probes for the available PHYs connected to a MAC. The MACs can be Emac0 (XPAR_XEMACPS_0_BASEADDR, 0xE000B000) or Emac1 (XPAR_XEMACPS_0_BASEADDR, 0xE000C000). It populates an array to notify about the detected PHYs. The array phymapemac0 is used for Emac0 and phymapemac1 is for Emac1. - The users need to parse the corresponding arrays, phymapemac0 or phymapemac1 to know the available PHYs for a MAC. The users then need to call phy_setup_emacps to setup the PHYs for proper speed setting. The API phy_setup_emacps should be called with the PHY address for which the speed needs to be negotiated or configured. In a specific use case, if 2 PHYs are connected to Emac0 with addresses of 7 and 11, then users get these address details from phymapemac0 (after calling detect_phy) and then call phy_setup_emacps twice,

with ab address of 7 and 11. - Points to note: The MAC can operate at only one speed. If a MAC is connected to multiple PHYs, then all PHYs must negotiate and configured for the same speed. - This file implements static functions to set proper SLCR clocks. As stated above, all PHYs connected to a PHY must operate at same speed and the SLCR clock will be setup accordingly. This file implements the following PHY types. - The standard RGMII. - It provides support for GMII to RGMII converter Xilinx IP. This Xilinx IP sits on the MDIO bus with a predefined PHY address. This IP exposes register that needs to be programmed with the negotiated speed. For example, in a typical design, the Emac0 or Emac1 exposes GMII interface. The user can then use the Xilinx IP that converts GMII to RGMII. The external PHY (most typically Marvell 88E1116R) negotiates for speed with the remote PHY. The implementation in this file then programs the Xilinx IP with this negotiated speed. The Xilinx IP has a predefined IP address exposed through xparameters.h - The SGMII and 1000 BaseX PHY interfaces. If the PHY interface is SGMII or 1000 BaseX a separate "get_IEEE_phy_speed" is used which is different from standard RGMII "get_IEEE_phy_speed". The 1000 BaseX always operates at 1000 Mbps. The SGMII interface can negotiate speed accordingly. For SGMII or 1000 BaseX interfaces, the detect_phy should not be called. The phy addresses for these interfaces are fixed at the design time. Point to note: A MAC can not be connected to PHYs where there is a mix between SGMII or 1000 Basex or GMII/MII/RGMII. In a typical multiple PHY designs, it is expected that the PHYs connected will be RGMII or GMII. The users can choose not to negotiate speed from lwip settings GUI. If they opt to choose a particular PHY speed, then the PHY will hard code the speed to operate only at the corresponding speed. It will not advertise any other speeds. It is users responsibility to ensure that the remote PHY supports the speed programmed through the lwip gui. The following combination of MDIO/PHY are supported: - Multiple PHYs connected to the MDIO bus of a MAC. If Emac0 MDIO is connected to single/multiple PHYs, it is supported. Similarly Emac1 MDIO connected to single/multiple PHYs is supported. - A design

where both the interfaces are present and are connected to their own MDIO bus is supported. The following MDIO/PHY setup is not supported: - A design has both the MACs present. MDIO bus is available only for one MAC (Emac0 or Emac1). This MDIO bus has multiple PHYs available for both the MACs. The negotiated speed for PHYs sitting on the MDIO bus of one MAC will not be see for the other MAC and hence the speed/SLCR settings of the other MAC cannot be programmed. Hence this kind of design will not work for this implementation.

This file is part of the lwIP TCP/IP stack. Author: Adam Dunkels <adam@sics.se> Simon Goldschmidt / @defgroup httpd HTTP server @ingroup apps This httpd supports for a rudimentary server-side-include facility which will replace tags of the form <!--tag in any file whose extension is .shtml, .shtm or .ssi with strings provided by an include handler whose pointer is provided to the module via function http_set_ssi_handler(). Additionally, a simple common gateway interface (CGI) handling mechanism has been added to allow clients to hook functions to particular request URIs. To enable SSI support, define label LWIP_HTTPD_SSI in lwipopts.h. To enable CGI support, define label LWIP_HTTPD_CGI in lwipopts.h. By default, the server assumes that HTTP headers are already present in each file stored in the file system. By defining LWIP_HTTPD_DYNAMIC_HEADERS in lwipopts.h, this behavior can be changed such that the server inserts the headers automatically based on the extension of the file being served. If this mode is used, be careful to ensure that the file system image used does not already contain the header information. File system images without headers can be created using the makefsfile tool with the -h command line option. Notes about valid SSI tags The following assumptions are made about tags used in SSI

markers: 1. No tag may contain '-' or whitespace characters within the tag name. 2. Whitespace is allowed between the tag leadin "<!--" and the start of the tag name and between the tag name and the leadout string "". 3. The maximum tag name length is LWIP_HTTPD_MAX_TAG_NAME_LEN, currently 8 characters. Notes on CGI usage The simple CGI support offered here works with GET method requests only and can handle up to 16 parameters encoded into the URI. The handler function may not write directly to the HTTP output but must return a filename that the HTTP server will send to the browser as a response to the incoming CGI request. The list of supported file types is quite short, so if makefsdata complains about an unknown extension, make sure to add it (and its doctype) to the 'g_psHTTPHeaders' list. /

Author: Christiaan Simons <christiaan.simons@axon.tv> Martin Hentschel <info@cl-soft.de> @defgroup snmp SNMPv2c agent @ingroup apps SNMPv2c compatible agent\n There is also a MIB compiler and a MIB viewer in lwIP contrib repository (lwip-contrib/apps/LwipMibCompiler).\n The agent implements the most important MIB2 MIBs including IPv6 support (interfaces, UDP, TCP, SNMP, ICMP, SYSTEM). IP MIB is an older version whithout IPv6 statistics (TODO).\n Rewritten by Martin Hentschel <info@cl-soft.de> and Dirk Ziegelmeier <dziegel@gmx.de>\n Work on

SNMPv3 has started, but is not finished.\n 0 Agent Capabilities Features: - SNMPv2c support. - Low RAM usage - no memory pools, stack only. - MIB2 implementation is separated from SNMP stack. - Support for multiple MIBs (snmp_set_mibs() call) - e.g. for private MIB. - Simple and generic API for MIB implementation. - Comfortable node types and helper functions for scalar arrays and tables. - Counter64, bit and truthvalue datatype support. - Callbacks for SNMP writes e.g. to implement persistency. - Runs on two APIs: RAW and netconn. - Async API is gone - the stack now supports netconn API instead, so blocking operations can be done in MIB calls. SNMP runs in a worker thread when netconn API is used. - Simplified thread sync support for MIBs - useful when MIBs need to access variables shared with other threads where no locking is possible. Used in MIB2 to access lwIP stats from lwIP thread. MIB compiler (code generator): - Provided in lwIP contrib repository. - Written in C. MIB viewer used Windows Forms. - Developed on Windows with Visual Studio 2010. - Can be compiled and used on all platforms with http://www.monodevelop.com/. - Based on a heavily modified version of of SharpSnmpLib (a4bd05c6afb4) (https://sharpsnmplib.codeplex.com/SourceControl/network/forks/Nemo157/MIBParserUpdate). - MIB parser, C file generation framework and LWIP code generation are cleanly separated, which means the code may be useful as a base for code generation of other SNMP agents. Notes: - Stack and MIB compiler were used to implement a Profinet device. Compiled/implemented MIBs: LLDP-MIB, LLDP-EXT-DOT3-MIB, LLDP-EXT-PNO-MIB. SNMPv1 per RFC1157 and SNMPv2c per RFC 3416 Note the S in SNMP stands for "Simple". Note that "Simple" is relative. SNMP is simple compared to the complex ISO network management protocols CMIP (Common Management Information Protocol) and CMOT (CMip Over Tcp). MIB II The standard lwIP stack management information base. This is a required MIB, so this is always enabled. The groups EGP, CMOT and transmission are disabled by default. Most mib-2 objects are not writable except: sysName, sysLocation, sysContact, snmpEnableAuthenTraps. Writing to or changing the ARP and IP address and route tables is not possible. Note lwIP has

a very limited notion of IP routing. It currently doen't have a route table and doesn't have a notion of the U,G,H flags. Instead lwIP uses the interface list with only one default interface acting as a single gateway interface (G) for the default route. The agent returns a "virtual table" with the default route 0.0.0.0 for the default interface and network routes (no H) for each network interface in the netif_list. All routes are considered to be up (U). Loading additional MIBs MIBs can only be added in compile-time, not in run-time. 1 Building the Agent First of all you'll need to add the following define to your local lwipopts.h: \define LWIP_SNMP 1 and add the source files your makefile. Note you'll might need to adapt you network driver to update the mib2 variables for your interface. 2 Running the Agent The following function calls must be made in your program to actually get the SNMP agent running. Before starting the agent you should supply pointers for sysContact, sysLocation, and snmpEnableAuthenTraps. You can do this by calling - snmp_mib2_set_syscontact() - snmp_mib2_set_syslocation() - snmp_set_auth_traps_enabled() You can register a callback which is called on successful write access: snmp_set_write_callback(). Additionally you may want to set - snmp_mib2_set_sysdescr() - snmp_set_device_enterprise_oid() - snmp_mib2_set_sysname() Also before starting the agent you need to setup one or more trap destinations using these calls: - snmp_trap_dst_enable() - snmp_trap_dst_ip_set() If you need more than MIB2, set the MIBs you want to use by snmp_set_mibs(). Finally, enable the agent by calling snmp_init() @defgroup snmp_core Core @ingroup snmp @defgroup snmp_traps Traps @ingroup snmp /

@file Common functions used throughout the stack. These are reference implementations of the byte swapping functions. Again with the aim of being simple, correct and fully portable. Byte swapping is the second thing you would want to optimize. You will need to port it to your architecture and in your cc.h: \define lwip_htons(x) your_htons \define lwip_htonl(x) your_htonl Note lwip_ntohs() and lwip_ntohl() are merely references to the htonx counterparts. If you \define them to htons() and htonl(), you should \define LWIP_DONT_PROVIDE_BYTEORDER_FUNCTIONS to prevent lwIP from defining htonx/ntohx compatibility macros. @defgroup sys_nonstandard Non-standard functions @ingroup sys_layer lwIP provides default implementations for non-standard functions. These can be mapped to OS functions to reduce code footprint if desired. All defines related to this section must not be placed in lwipopts.h, but in arch/cc.h! These options cannot be \defined in lwipopts.h since they are not options of lwIP itself, but options of the lwIP port to your system. / Copyright (c) 2001-2004 Swedish Institute of Computer Science. @file DNS - host name to IP address resolver. @defgroup dns DNS @ingroup callbackstyle_api Implements a DNS host name to IP address resolver. The lwIP DNS resolver functions are used to lookup a host name and map it to a numerical IP address. It maintains a list of resolved hostnames that can be queried with the dns_lookup() function. New hostnames can be resolved using the dns_query() function. The lwIP version of the resolver also adds a non-blocking version of gethostbyname() that will work with a raw API application. This function checks for an IP address string first and converts it if it is valid. gethostbyname() then does a dns_lookup() to see if the name is already in the table. If so, the IP is returned. If not, a query is issued and the function returns with a ERR_INPROGRESS status. The app using the dns client must then go into a waiting state. Once a hostname has been resolved (or found to be non-existent), the resolver code calls a specified callback function (which must be implemented by the module that uses the resolver). Multicast DNS queries are supported for names ending on ".local". However, only "One-Shot Multicast DNS Queries" are supported (RFC 6762 chapter 5.1), this is not a fully compliant implementation of continuous mDNS querying! All functions must be called from TCPIP thread. @see @ref netconn_common for thread-safe access. / Port to lwIP from uIP by Jim Pettinato April 2007 security fixes and more by Simon Goldschmidt uIP version Copyright (c) 2002-2003, Adam Dunkels. @file Packet buffer management / @defgroup pbuf Packet buffers (PBUF) @ingroup infrastructure Packets are built from the pbuf data structure. It supports dynamic memory allocation for packet contents or can reference externally managed packet contents both in RAM and ROM. Quick allocation for incoming packets is provided through pools with fixed sized pbufs. A packet may span over multiple pbufs, chained as a singly linked list. This is called a "pbuf chain". Multiple packets may be queued, also using this singly linked list. This is called a "packet queue". So, a packet queue consists of one or more pbuf chains, each of which consist of one or more pbufs. CURRENTLY, PACKET QUEUES ARE NOT SUPPORTED!!! Use helper structs to queue multiple packets. The differences between a pbuf chain and a packet queue are very precise but subtle. The last pbuf of a packet has a ->tot_len field that equals the ->len field. It can be found by traversing the list. If the last pbuf of a packet has a ->next field other than NULL, more packets are on the queue. Therefore, looping through a pbuf of a single packet, has an loop end condition (tot_len p->len), NOT (next NULL). Example of custom pbuf usage for zero-copy RX: @code{.c} typedef struct my_custom_pbuf { struct pbuf_custom p; void dma_descriptor; } my_custom_pbuf_t; LWIP_MEMPOOL_DECLARE(RX_POOL, 10, sizeof(my_custom_pbuf_t), "Zero-copy RX PBUF pool"); void my_pbuf_free_custom(void p) { my_custom_pbuf_t my_puf (my_custom_pbuf_t)p; LOCK_INTERRUPTS();

free_rx_dma_descriptor(my_pbuf->dma_descriptor); LWIP_MEMPOOL_FREE(RX_POOL, my_pbuf); UNLOCK_INTERRUPTS(); } void eth_rx_irq() { dma_descriptor dma_desc get_RX_DMA_descriptor_from_ethernet(); my_custom_pbuf_t my_pbuf (my_custom_pbuf_t)LWIP_MEMPOOL_ALLOC(RX_POOL); my_pbuf->p.custom_free_function my_pbuf_free_custom; my_pbuf->dma_descriptor dma_desc; invalidate_cpu_cache(dma_desc->rx_data, dma_desc->rx_length); struct pbuf p pbuf_alloced_custom(PBUF_RAW, dma_desc->rx_length, PBUF_REF, &my_pbuf->p, dma_desc->rx_data, dma_desc->max_buffer_size); if(netif->input(p, netif) ! ERR_OK) { pbuf_free(p); } } @endcode / Copyright (c) 2001-2004 Swedish Institute of Computer Science. All rights reserved. @file Dynamic Host Configuration Protocol client @defgroup dhcp4 DHCPv4 @ingroup

ip4 DHCP (IPv4) related functions This is a DHCP client for the lwIP TCP/IP stack. It aims to conform with RFC 2131 and RFC 2132. @todo: - Support for interfaces other than Ethernet (SLIP, PPP, ...) Options: @ref DHCP_COARSE_TIMER_SECS (recommended 60 which is a minute) @ref DHCP_FINE_TIMER_MSECS (recommended 500 which equals TCP coarse timer) dhcp_start() starts a DHCP client instance which configures the interface by obtaining an IP address lease and maintaining it. Use dhcp_release() to end the lease and use dhcp_stop() to remove the DHCP client. @see netifapi_dhcp4 /

(INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE. This file is built upon the file: src/arch/rtxc/netif/sioslip.c Author: Magnus Ivarsson <magnus.ivarsson(at)volvo.com> Simon Goldschmidt / @defgroup slipif SLIP netif @ingroup addons This is an arch independent SLIP netif. The specific serial hooks must be provided by another file. They are sio_open, sio_read/sio_tryread and sio_send Usage: This netif can be used in three ways:\n 1) For NO_SYS0, an RX thread can be used which blocks on sio_read() until data is received.\n 2) In your main loop, call slipif_poll() to check for new RX bytes, completed packets are fed into netif->input().\n 3) Call slipif_received_byte[s]() from your serial RX ISR and slipif_process_rxqueue() from your main loop. ISR level decodes packets and puts completed packets on a queue which is fed into the stack from the main loop (needs SYS_LIGHTWEIGHT_PROT for pbuf_alloc to work on ISR level!). /

lpesonen@clinet.fi, april 1997 Implemented LANManager type password response to MS-CHAP challenges. Now pppd provides both NT style and LANMan style blocks, and the preferred is set by option "ms-lanman". Default is to use NT. The hash text (StdText) was taken from Win95 RASAPI32.DLL. You should also use DOMAIN\\USERNAME as described in README.MSCHAP80 / Modifications by Frank Cusack, frank@google.com, March 2002. Implemented MS-CHAPv2 functionality, heavily based on sample implementation in RFC 2759. Implemented MPPE functionality, heavily based on sample implementation in RFC 3079. eap.c - Extensible Authentication Protocol for PPP (RFC 2284) Copyright (c) 2001 by Sun Microsystems, Inc. All rights reserved. Non-exclusive rights to redistribute, modify, translate, and use this software in source and binary forms, in whole or in part, is hereby granted, provided that the above copyright notice is duplicated in any source form, and that neither the name of the copyright holder nor the author is used to endorse or promote products derived from this software. THIS SOFTWARE IS PROVIDED ``AS IS'' AND WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTIBILITY AND FITNESS FOR A PARTICULAR PURPOSE. Original version by James Carlson This implementation of EAP supports MD5-Challenge and SRP-SHA1 authentication styles. Note that support of MD5-Challenge is a requirement of RFC 2284, and that it's essentially just a reimplementation of regular RFC 1994 CHAP using EAP messages. As an authenticator ("server"), there are multiple phases for each style. In the first phase of each style, the unauthenticated peer name is queried using the EAP Identity request type. If the "remotename" option is used, then this phase is skipped, because the peer's name is presumed to be known. For MD5-Challenge, there are two phases, and the second phase consists of sending the challenge itself and handling the associated response. For SRP-SHA1, there are four phases. The second sends 's', 'N', and 'g'. The reply contains 'A'. The third sends 'B', and the reply contains 'M1'. The forth sends the 'M2' value. As an authenticatee ("client"), there's just a single phase responding to the queries generated by the peer. EAP is an authenticator-driven protocol. Based on draft-ietf-pppext-eap-srp-03.txt. /

Permission to use, copy, modify, and distribute this software and its

documentation is hereby granted, provided that the above copyright notice

appears in all copies. This software is provided without any warranty, express

or implied. Changelog: 08/12/05 - Matt Domsch <Matt_Domsch@dell.com> Only need

extra skb padding on transmit, not receive. 06/18/04 - Matt Domsch

<Matt_Domsch@dell.com>, Oleg Makarenko <mole@quadra.ru> Use Linux kernel 2.6

arc4 and sha1 routines rather than providing our own. 2/15/04 - TS: added

include <version.h> and testing for Kernel version before using

MOD_DEC_USAGE_COUNT/MOD_INC_USAGE_COUNT which are deprecated in 2.6 /

Author: Christiaan Simons <christiaan.simons@axon.tv> Martin Hentschel <info@cl-soft.de> @defgroup snmp SNMPv2c/v3 agent @ingroup apps SNMPv2c and SNMPv3 compatible agent\n There is also a MIB compiler and a MIB viewer in lwIP contrib repository (lwip-contrib/apps/LwipMibCompiler).\n The agent implements the most important MIB2 MIBs including IPv6 support (interfaces, UDP, TCP, SNMP, ICMP, SYSTEM). IP MIB is an older version without IPv6 statistics (TODO).\n Rewritten by Martin Hentschel <info@cl-soft.de> and Dirk Ziegelmeier <dziegel@gmx.de>\n 0 Agent Capabilities Features: - SNMPv2c support. - SNMPv3 support (a port to ARM mbedtls is provided, LWIP_SNMP_V3_MBEDTLS option). - Low RAM usage - no memory pools, stack only. - MIB2 implementation is separated from SNMP stack. - Support for multiple MIBs (snmp_set_mibs() call) - e.g. for private MIB. - Simple and generic API for MIB implementation. - Comfortable node types and helper functions for scalar arrays and tables. - Counter64, bit and truthvalue datatype support. - Callbacks for SNMP writes e.g. to implement persistency. - Runs on two APIs: RAW and netconn. - Async API is gone - the stack now supports netconn API instead, so blocking operations can be done in MIB calls. SNMP runs in a worker thread when netconn API is used. - Simplified thread sync support for MIBs - useful when MIBs need to access variables shared with other threads where

no locking is possible. Used in MIB2 to access lwIP stats from lwIP thread. MIB compiler (code generator): - Provided in lwIP contrib repository. - Written in C. MIB viewer used Windows Forms. - Developed on Windows with Visual Studio 2010. - Can be compiled and used on all platforms with http://www.monodevelop.com/. - Based on a heavily modified version of of SharpSnmpLib (a4bd05c6afb4) (https://sharpsnmplib.codeplex.com/SourceControl/network/forks/Nemo157/MIBParserUpdate). - MIB parser, C file generation framework and LWIP code generation are cleanly separated, which means the code may be useful as a base for code generation of other SNMP agents. Notes: - Stack and MIB compiler were used to implement a Profinet device. Compiled/implemented MIBs: LLDP-MIB, LLDP-EXT-DOT3-MIB, LLDP-EXT-PNO-MIB. SNMPv1 per RFC1157 and SNMPv2c per RFC 3416 Note the S in SNMP stands for "Simple". Note that "Simple" is relative. SNMP is simple compared to the complex ISO network management protocols CMIP (Common Management Information Protocol) and CMOT (CMip Over Tcp). SNMPv3 When SNMPv3 is used, several functions from snmpv3.h must be implemented by the user. This is mainly user management and persistence handling. The sample provided in lwip-contrib is insecure, don't use it in production systems, especially the missing persistence for engine boots variable simplifies replay attacks. MIB II The standard lwIP stack management information base. This is a required MIB, so this is always enabled. The groups EGP, CMOT and transmission are disabled by default. Most mib-2 objects are not writable except: sysName, sysLocation, sysContact, snmpEnableAuthenTraps. Writing to or changing the ARP and IP address and route tables is not possible. Note lwIP has a very limited notion of IP routing. It currently doesn't have a route table and doesn't have a notion of the U,G,H flags. Instead lwIP uses the interface list with only one default interface acting as a single gateway interface (G) for the default route. The agent returns a "virtual table" with the default route 0.0.0.0 for the default interface and network routes (no H) for each network interface in the netif_list. All routes are considered to be up (U). Loading

additional MIBs MIBs can only be added in compile-time, not in run-time. 1 Building the Agent First of all you'll need to add the following define to your local lwipopts.h: \define LWIP_SNMP 1 and add the source files your makefile. Note you'll might need to adapt you network driver to update the mib2 variables for your interface. 2 Running the Agent The following function calls must be made in your program to actually get the SNMP agent running. Before starting the agent you should supply pointers for sysContact, sysLocation, and snmpEnableAuthenTraps. You can do this by calling - snmp_mib2_set_syscontact() - snmp_mib2_set_syslocation() - snmp_set_auth_traps_enabled() You can register a callback which is called on successful write access: snmp_set_write_callback(). Additionally you may want to set - snmp_mib2_set_sysdescr() - snmp_set_device_enterprise_oid() - snmp_mib2_set_sysname() Also before starting the agent you need to setup one or more trap destinations using these calls: - snmp_trap_dst_enable() - snmp_trap_dst_ip_set() If you need more than MIB2, set the MIBs you want to use by snmp_set_mibs(). Finally, enable the agent by calling snmp_init() @defgroup snmp_core Core @ingroup snmp @defgroup snmp_traps Traps @ingroup snmp /

@file @defgroup altcp Application layered TCP Functions @ingroup altcp_api This file contains the common functions for altcp to work. For more details see @ref altcp_api. / @defgroup altcp_api Application layered TCP Introduction @ingroup callbackstyle_api Overview altcp (application layered TCP connection API; to be used from TCPIP thread) is an abstraction layer that prevents applications linking hard against the @ref tcp.h functions while providing the same functionality. It is used to e.g. add SSL/TLS (see LWIP_ALTCP_TLS) or proxy-connect support to an application written for the tcp callback API without that application knowing the protocol details. This interface mimics the tcp callback API to the application while preventing direct linking (much like virtual functions). This way, an application can make use of other application layer protocols on top of TCP without knowing the details (e.g. TLS, proxy connection). This is achieved by simply including "lwip/altcp.h" instead of "lwip/tcp.h", replacing "struct tcp_pcb" with "struct altcp_pcb" and prefixing all functions with "altcp_" instead of "tcp_". With altcp support disabled (LWIP_ALTCP0), applications written against the altcp API can still be compiled but are directly linked against the tcp.h callback API and then cannot use layered protocols. To minimize code changes in this case, the use of altcp_allocators is strongly suggested. Usage To make use of this API from an existing tcp raw API application: Include "lwip/altcp.h" instead of "lwip/tcp.h" Replace "struct tcp_pcb" with "struct altcp_pcb" Prefix all called tcp API functions with "altcp_" instead of "tcp_" to link against the altcp functions @ref altcp_new (and @ref altcp_new_ip_type/@ref altcp_new_ip6) take an @ref altcp_allocator_t as an argument, whereas the original tcp API functions take no

arguments. An @ref altcp_allocator_t allocator is an object that holds a pointer to an allocator object and a corresponding state (e.g. for TLS, the corresponding state may hold certificates or keys). This way, the application does not even need to know if it uses TLS or pure TCP, this is handled at runtime by passing a specific allocator. An application can alternatively bind hard to the altcp_tls API by calling @ref altcp_tls_new or @ref altcp_tls_wrap. The TLS layer is not directly implemented by lwIP, but a port to mbedTLS is provided. Another altcp layer is proxy-connect to use TLS behind a HTTP proxy (see @ref altcp_proxyconnect.h) altcp_allocator_t An altcp allocator is created by the application by combining an allocator callback function and a corresponding state, e.g.:\code{.c} static const unsigned char cert[] {0x2D, ... (see mbedTLS doc for how to create this)}; struct altcp_tls_config conf altcp_tls_create_config_client(cert, sizeof(cert)); altcp_allocator_t tls_allocator { altcp_tls_alloc, conf }; \endcode struct altcp_tls_config The struct altcp_tls_config holds state that is needed to create new TLS client or server connections (e.g. certificates and private keys). It is not defined by lwIP itself but by the TLS port (e.g. altcp_tls to mbedTLS adaption). However, the parameters used to create it are defined in @ref altcp_tls.h (see @ref altcp_tls_create_config_server_privkey_cert for servers and @ref altcp_tls_create_config_client/@ref altcp_tls_create_config_client_2wayauth for clients). For mbedTLS, ensure that certificates can be parsed by 'mbedtls_x509_crt_parse()' and private keys can be parsed by 'mbedtls_pk_parse_key()'. / Copyright (c) 2017 Simon Goldschmidt All rights reserved. @file DNS - host name to IP address resolver. @defgroup dns DNS @ingroup callbackstyle_api Implements a DNS host name to IP address resolver. The lwIP DNS resolver functions are used to lookup a host name and map it to a numerical IP address. It maintains a list of resolved hostnames that can be queried with the dns_lookup() function. New hostnames can be resolved using the dns_query() function. The lwIP version of the resolver also adds a non-blocking version of gethostbyname() that will work with a raw API application. This function checks for an IP address string first and converts it if it is valid. gethostbyname() then does a dns_lookup() to see if the name is already in the table. If so, the IP is returned. If not, a query is issued and the function returns with a ERR_INPROGRESS status. The app using the dns client must then go into a waiting state. Once a hostname has been resolved (or found to be non-existent), the resolver code calls a specified callback function (which must be implemented by the module that uses the resolver). Multicast DNS queries are supported for names ending on ".local". However, only "One-Shot Multicast DNS Queries" are supported (RFC 6762 chapter 5.1), this is not a fully compliant implementation of continuous mDNS querying! All functions must be called from TCPIP thread. @see DNS_MAX_SERVERS @see LWIP_DHCP_MAX_DNS_SERVERS @see @ref netconn_common for thread-safe access. / Port to lwIP from uIP by Jim Pettinato April 2007 security

@file Packet buffer management / @defgroup pbuf Packet buffers (PBUF) @ingroup infrastructure Packets are built from the pbuf data structure. It supports dynamic memory allocation for packet contents or can reference externally managed packet contents both in RAM and ROM. Quick allocation for incoming packets is provided through pools with fixed sized pbufs. A packet may span over multiple pbufs, chained as a singly linked list. This is called a "pbuf chain". Multiple packets may be queued, also using this singly linked list. This is called a "packet queue". So, a packet queue consists of one or more pbuf chains, each of which consist of one or more pbufs. CURRENTLY, PACKET QUEUES ARE NOT SUPPORTED!!! Use helper structs to queue multiple packets. The differences between a pbuf chain and a packet queue are very precise but subtle. The last pbuf of a packet has a ->tot_len field that equals the ->len field. It can be found by traversing the list. If the last pbuf of a packet has a ->next field

other than NULL, more packets are on the queue. Therefore, looping through a pbuf of a single packet, has an loop end condition (tot_len p->len), NOT (next NULL). Example of custom pbuf usage: @ref zerocopyrx / Copyright (c) 2001-2004 Swedish Institute of Computer Science. All rights reserved. SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE. This file is part of the lwIP TCP/IP stack. Author: Adam Dunkels <adam@sics.se> / @defgroup sys_layer Porting (system abstraction layer) @ingroup lwip @defgroup sys_os OS abstraction layer @ingroup sys_layer No need to implement functions in this section in NO_SYS mode. The OS-specific code should be implemented in arch/sys_arch.h and sys_arch.c of your port. The operating system emulation layer provides a common interface between the lwIP code and the underlying operating system kernel. The general idea is that porting lwIP to new architectures requires only small changes to a few header files and a new sys_arch implementation. It is also possible to do a sys_arch implementation that does not rely on any underlying operating system. The sys_arch provides semaphores, mailboxes and mutexes to lwIP. For the full lwIP functionality, multiple threads support can be implemented in the sys_arch, but this is not required for the basic lwIP functionality. Timer scheduling is implemented in lwIP, but can be implemented by the sys_arch port (LWIP_TIMERS_CUSTOM1). In addition to the source file providing the functionality of sys_arch, the OS emulation layer must provide several header files defining macros used throughout lwip. The files required and the macros they must define are listed below the sys_arch description. Since lwIP 1.4.0, semaphore, mutexes and mailbox functions are prototyped in a way that allows both using pointers or actual OS structures to be used. This way, memory required for such types can be either allocated in place (globally or on the stack) or on the heap (allocated internally in the "_new()" functions). Note: Be careful with using mem_malloc() in sys_arch. When malloc() refers to mem_malloc() you can run into a circular function call problem. In mem.c mem_init() tries to allocate a semaphore using mem_malloc, which of course can't be performed when sys_arch uses mem_malloc. @defgroup sys_sem Semaphores @ingroup sys_os Semaphores can be either counting or binary - lwIP works with both kinds. Semaphores are represented by the type "sys_sem_t" which is typedef'd in the sys_arch.h file. Mailboxes are

equivalently represented by the type "sys_mbox_t". Mutexes are represented by the type "sys_mutex_t". lwIP does not place any restrictions on how these types are represented internally. @defgroup sys_mutex Mutexes @ingroup sys_os Mutexes are recommended to correctly handle priority inversion, especially if you use LWIP_CORE_LOCKING . @defgroup sys_mbox Mailboxes @ingroup sys_os Mailboxes should be implemented as a queue which allows multiple messages to be posted (implementing as a rendez-vous point where only one message can be posted at a time can have a highly negative impact on performance). A message in a mailbox is just a pointer, nothing more. @defgroup sys_time Time @ingroup sys_layer @defgroup sys_prot Critical sections @ingroup sys_layer Used to protect short regions of code against concurrent access. - Your system is a bare-metal system (probably with an RTOS) and interrupts are under your control: Implement this as LockInterrupts() / UnlockInterrupts() - Your system uses an RTOS with deferred interrupt handling from a worker thread: Implement as a global mutex or lock/unlock scheduler - Your system uses a high-level OS with e.g. POSIX signals: Implement as a global mutex @defgroup sys_misc Misc @ingroup sys_os /

@file Transmission Control Protocol for IP See also @ref tcp_raw @defgroup tcp_raw TCP @ingroup callbackstyle_api Transmission Control Protocol for IP\n

@see @ref api Common functions for the TCP implementation, such as functions for manipulating the data structures and the TCP timer functions. TCP functions related to input and output is found in tcp_in.c and tcp_out.c respectively.\n TCP connection setup The functions used for setting up connections is similar to that of the sequential API and of the BSD socket API. A new TCP connection identifier (i.e., a protocol control block - PCB) is created with the tcp_new() function. This PCB can then be either set to listen for new incoming connections or be explicitly connected to another host. - tcp_new() - tcp_bind() - tcp_listen() and tcp_listen_with_backlog() - tcp_accept() - tcp_connect() Sending TCP data TCP data is sent by enqueueing the data with a call to tcp_write() and triggering to send by calling tcp_output(). When the data is successfully transmitted to the remote host, the application will be notified with a call to a specified callback function. - tcp_write() - tcp_output() - tcp_sent() Receiving TCP data TCP data reception is callback based - an application specified callback function is called when new data arrives. When the application has taken the data, it has to call the tcp_recved() function to indicate that TCP can advertise increase the receive window. - tcp_recv() - tcp_recved() Application polling When a connection is idle (i.e., no data is either transmitted or received), lwIP will repeatedly poll the application by calling a specified callback function. This can be used either as a watchdog timer for killing connections that have stayed idle for too long, or as a method of waiting for memory to become available. For instance, if a call to tcp_write() has failed because memory wasn't available, the application may use the polling functionality to call tcp_write() again when the connection has been idle for a while. - tcp_poll() Closing and aborting connections - tcp_close() - tcp_abort() - tcp_err() / Copyright (c) 2001-2004 Swedish Institute of Computer Science. @file IPv6 address scopes, zones, and scoping policy. This header provides the means to implement support for IPv6 address scopes, as per RFC 4007. An address scope can be either global or more constrained. In lwIP, we say that an address "has a scope" or "is scoped" when its scope is constrained, in which case the address is meaningful only in a specific "zone." For unicast addresses, only link-local addresses have a scope; in that case, the scope is the link. For multicast addresses, there are various scopes defined by RFC 4007 and others. For any constrained scope, a system must establish a (potentially one-to-many) mapping between zones and local interfaces. For example, a link-local address is valid on only one link (its zone). That link may be attached to one or more local interfaces. The decisions on which scopes are constrained and the mapping between zones and interfaces is together what we refer to as the "scoping policy" - more on this in a bit. In lwIP, each IPv6 address has an associated zone index. This zone index may be set to "no zone" (IP6_NO_ZONE, 0) or an actual zone. We say that an address "has a zone" or "is zoned" when its zone index is not set to "no zone." In lwIP, in principle, each address should be "properly zoned," which means that if the address has a zone if and only if has a scope. As such, it is a rule that an unscoped (e.g., global) address must never have a zone. Even though one could argue that there is always one zone even for global scopes, this rule exists for implementation simplicity. Violation of the rule will trigger assertions or otherwise result in undesired behavior. Backward compatibility prevents us from requiring that applications always provide properly zoned addresses. We do enforce the rule that the in the lwIP link layer (everything below netif->output_ip6() and in particular ND6) all

addresses are properly zoned. Thus, on the output paths down the stack, various places deal with the case of addresses that lack a zone. Some of them are best-effort for efficiency (e.g. the PCB bind and connect API calls' attempts to add missing zones); ultimately the IPv6 output handler (@ref ip6_output_if_src) will set a zone if necessary. Aside from dealing with scoped addresses lacking a zone, a proper IPv6 implementation must also ensure that a packet with a scoped source and/or destination address does not leave its zone. This is currently implemented in the input and forward functions. However, for output, these checks are deliberately omitted in order to keep the implementation lightweight. The routing algorithm in @ref ip6_route will take decisions such that it will not cause zone violations unless the application sets bad addresses, though. In terms of scoping policy, lwIP implements the default policy from RFC 4007 using macros in this file. This policy considers link-local unicast addresses and (only) interface-local and link-local multicast addresses as having a scope. For all these addresses, the zone is equal to the interface. As shown below in this file, it is possible to implement a custom policy. / Copyright (c) 2017 The MINIX 3 Project. All rights reserved. This file is part of the lwIP TCP/IP stack. Author: Simon Goldschmidt <goldsimon@gmx.de> / @defgroup bridgeif IEEE 802.1D bridge @ingroup netifs This file implements an IEEE 802.1D bridge by

using a multilayer netif approach (one hardware-independent netif for the bridge that uses hardware netifs for its ports). On transmit, the bridge selects the outgoing port(s). On receive, the port netif calls into the bridge (via its netif->input function) and the bridge selects the port(s) (and/or its netif->input function) to pass the received pbuf to. Usage: - add the port netifs just like you would when using them as dedicated netif without a bridge - only NETIF_FLAG_ETHARP/NETIF_FLAG_ETHERNET netifs are supported as bridge ports - add the bridge port netifs without IPv4 addresses (i.e. pass 'NULL, NULL, NULL') - don't add IPv6 addresses to the port netifs! - set up the bridge configuration in a global variable of type 'bridgeif_initdata_t' that contains - the MAC address of the bridge - some configuration options controlling the memory consumption (maximum number of ports and FDB entries) - e.g. for a bridge MAC address 00-01-02-03-04-05, 2 bridge ports, 1024 FDB entries + 16 static MAC entries: bridgeif_initdata_t mybridge_initdata BRIDGEIF_INITDATA1(2, 1024, 16, ETH_ADDR(0, 1, 2, 3, 4, 5)); - add the bridge netif (with IPv4 config): struct netif bridge_netif; netif_add(&bridge_netif, &my_ip, &my_netmask, &my_gw, &mybridge_initdata, bridgeif_init, tcpip_input); NOTE: the passed 'input' function depends on BRIDGEIF_PORT_NETIFS_OUTPUT_DIRECT setting, which controls where the forwarding is done (netif low level input context vs. tcpip_thread) - set up all ports netifs and the bridge netif - When adding a port netif, NETIF_FLAG_ETHARP flag will be removed from a port to prevent ETHARP working on that port netif (we only want one IP per bridge not per port). - When adding a port netif, its input function is changed to call into the bridge. @todo: - compact static FDB entries (instead of walking the whole array) - add FDB query/read access - add FDB change callback (when learning or dropping auto-learned entries) - prefill FDB with MAC classes that should never be forwarded - multicast snooping? (and only forward group addresses to interested ports) - support removing ports - check SNMP integration - VLAN handling / trunk ports - priority handling? (although that largely depends on TX queue limitations and

lwIP doesn't provide tx-done handling) /

Author: Benjamin Aigner <aignerb @technikum-wien.at> Based on the original 6lowpan implementation of lwIP ( @see 6lowpan.c) / @defgroup rfc7668if 6LoWPAN over BLE (RFC7668) @ingroup netifs This file implements a RFC7668 implementation for 6LoWPAN over Bluetooth Low Energy. The specification is very similar to 6LoWPAN, so most of the code is re-used. Compared to 6LoWPAN, much functionality is already implemented in lower BLE layers (fragmenting, session management,...). Usage: - add this netif - don't add IPv4 addresses (no IPv4 support in RFC7668), pass 'NULL','NULL','NULL' - use the BLE to EUI64 conversation util to create an IPv6 link-local address from the BLE MAC (@ref ble_addr_to_eui64) - input function: @ref rfc7668_input - set the link output function, which transmits output data to an established L2CAP channel - If data arrives (HCI event "L2CAP_DATA_PACKET"): - allocate a @ref PBUF_RAW buffer - let the pbuf struct point to the incoming data or copy it to the buffer - call netif->input @todo: - further testing - support compression contexts - support multiple addresses - support multicast - support neighbor discovery /

This file is built upon the file: src/arch/rtxc/netif/sioslip.c Author: Magnus Ivarsson <magnus.ivarsson(at)volvo.com> Simon Goldschmidt / @defgroup slipif SLIP @ingroup netifs This is an arch independent SLIP netif. The specific serial hooks must be provided by another file. They are sio_open, sio_read/sio_tryread and sio_send Usage: This netif can be used in three ways:\n 1) For NO_SYS0, an RX thread can be used which blocks on sio_read() until data is received.\n 2) In your main loop, call slipif_poll() to check for new RX bytes, completed packets are fed into netif->input().\n 3) Call slipif_received_byte[s]() from your serial RX ISR and slipif_process_rxqueue() from your main loop. ISR level decodes packets and puts completed packets on a queue which is fed into the stack from the main loop (needs SYS_LIGHTWEIGHT_PROT for pbuf_alloc to work on ISR level!). /

THIS COPYRIGHT NOTICE AND DISCLAIMER MUST BE RETAINED AS PART OF THIS FILE AT

ALL TIMES. @file xusb_keyboard.c This file contains an example for USB keyboard. @note - The example is tested on ML403 and ML507 evaluation boards. The push buttons SW3,SW4,SW5 and SW7 on the ML403 evaluation board are used in the example for the key action of the USB keyboard.The push buttons SW10, SW11, SW12, SW13 and SW14 are used on the ML507 board. The example sends a character from a fixed sequence of characters from the device as and when any of the SW3 or SW4 or SW5 and SW7 push button is pressed. The fixed sequence of characters is XILINX USB KEYBOARD DEMO. The SW6 push button switch is used to complete the test. SW14 is used on ML507 board to complete the test. - The GPIO device has to be added to the hardware design so that the push buttons on the evaluation board could be used. If we enable the debug statements in the xusb_cp9.c file, we must add the UARTLite core to the hardware design. Debug messages can be enabled by defining the constant XUSB_DEBUG, - To run this example, the evaluation board is to be connected to a windows Host PC over the USB port. - The example configures the USB device for endpoint 0 and endpoint 1. Endpoint 0 is the control endpoint and is configured for a maximum packet length of 64 bytes. End point 1 is configured for INTERRUPT IN transactions and the maximum packet size is configured as 16 bytes. - The USB keyboard example code has to be compiled along with the xusb_cp9.c file. The xusb_cp9.c file contains all the USB enumeration related functions. To compile the code for USB keyboard example, the constant definitions HID_DEVICES and USB_KEYBOARD are to be defined and the definitions the constants USB_MOUSE and MASS_STORAGE_DEVICE are to be undefined. These definitions can be found in the xusb_types.h file. <pre> MODIFICATION HISTORY: Ver Who Date Changes ----- ---- 1.00a hvm 5/31/07 First release 3.00a hvm 11/18/09 Updated to use HAL processor APIs. XUsb_mReadReg is renamed to XUsb_ReadReg and XUsb_mWriteReg is renamed to XUsb_WriteReg. 4.00a hvm 08/11/11 Updated the code in gpio isr to increment the index by 4 as a dummy byte is added in the Message variable in keyboard.h file to handle the address alignment issue. 4.02a bss 11/01/11 Modified UsbIfIntrHandler function to unconditionally

reset when USB reset is asserted (CR 627574). </pre> / Include Files /

consequential loss or damage (including loss of data, profits, goodwill, or any type of loss or damage suffered as a result of any action brought by a third party) even if such damage or loss was reasonably foreseeable or Xilinx had been advised of the possibility of the same. CRITICAL APPLICATIONS Xilinx products are not designed or intended to be fail-safe, or for use in any application requiring fail-safe performance, such as life-support or safety devices or systems, Class III medical devices, nuclear facilities, applications related to the deployment of airbags, or any other applications that could lead to death, personal injury, or severe property or environmental damage (individually and collectively, "Critical Applications"). Customer assumes the sole risk and liability of any use of Xilinx products in Critical Applications, subject only to applicable laws and regulations governing limitations on product liability. THIS COPYRIGHT NOTICE AND DISCLAIMER MUST BE RETAINED AS PART OF THIS FILE AT ALL TIMES. @file xusb.h @addtogroup usb_v5_2 @{ @details This file contains the implementation of the XUsb component. It is the driver for the USB device controller. The USB device controller supports the following features: - USB 2.0 Specification supporting High/Full/Low Speed - 8 Endpoints - 1 Control Endpoint - 7 Configurable Endpoints, which can be configured as IN or OUT , and configurable as Interrupt or Bulk or Isochronous - 2 Ping Pong Buffers for all the endpoints except the Control Endpoint Initialization & Configuration The device driver enables higher layer software (e.g., an application) to communicate to the USB device. Apart from transmission and reception of USB frames the driver also handles the configuration of the device. A single device driver can support multiple USB devices. XUsb_CfgInitialize() API is used to initialize the USB device. The user needs to first call the XUsb_LookupConfig() API which returns the Configuration structure pointer which is passed as a parameter to the XUsb_CfgInitialize() API. - Configuration of the DEVICE endpoints: The endpoints of the device need to be configured using the XUsb_EpConfigure() function call. After configuration is complete, the endpoints

need to be initialized using the XUsb_EpInitializeAll() function call.  PHY Communication  As the H/W doesn't give any provision for the driver to configure the PHY, the driver doesn't provide any mechanism for directly programming the PHY.  DMA  The USB device has an inbuilt DMA. It's a simple DMA for data transfer between endpoint buffer memory and the external memory. The driver has two APIs for DMA operation. one API is used for resetting the DMA module of the USB device. The other API is for initiating the DMA transfer. The DMA transfer API is internal to the driver and is used by the USB endpoint data send and data receive functions. Upon completion of DMA transfer the USB device sets the buffer ready bit of the endpoint for which the DMA transfer is initiated. Setting of the buffer ready bit enables transmission/reception of an endpoint data. To enable the USB device to know to which endpoint the current DMA transfer is initiated, the driver writes the buffer ready mask to the DMA control register. The DMA in the device can be enabled or disabled only during the system build time.  Interrupts  The driver provides an interrupt handler XUsb_IntrHandler for handling the interrupt from the USB device. The users of this driver have to register this handler with the interrupt system and provide the callback functions. The interrupt handlers and associated callback functions for the USB device have to be registered by the user using the XUsb_IntrSetHandler() function and/or XUsb_EpSetHandler() function. XUsb_IntrSetHandler() function installs an asynchronous callback function for the general interrupts (interrupts other than the endpoint interrupts). XUsb_EpSetHandler() function installs the callback functions for the interrupts related to the endpoint events. A separate callback function has to be installed for each of the endpoints.  Virtual Memory  This driver supports Virtual Memory. The RTOS is responsible for calculating the correct device base address in Virtual Memory space.  Threads  This driver is not thread safe. Any needs for threads or thread mutual exclusion must be satisfied by the layer above this driver.  Asserts  Asserts are used within all

Xilinx drivers to enforce constraints on argument values. Asserts can be turned off on a system-wide basis by defining, at compile time, the NDEBUG identifier. By default, asserts are turned on and it is recommended that users leave asserts on during development.  Building the driver  The XUsb driver is composed of several source files. This allows the user to build and link only those parts of the driver that are necessary. <pre> MODIFICATION HISTORY: Ver Who Date Changes ----- ---- -------- 1.00a hvm 02/22/07 First release. 1.01a hvm 05/30/07 The chapter 9 files are moved to examples directory. 1.01a sdm 08/22/08 Removed support for static interrupt handlers from the MDD file 1.01a hvm 10/02/08 The Buffer0Ready, Buffer1Ready are declared as volatile. In function XUsb_EpDataRecv, the initialization of Buffer0Ready, Buffer1Ready and CurBufNum variables is moved before the buffer ready bit is set in the buffer ready register. Added the initialization of Buffer0Ready, Buffer1Ready and CurBufNum variables in the XUsb_EpDataSecd function. 2.00a hvm 10/22/08 Added Support for the new XPS USB device. The new device has support for DMA. Apart from the DMA, remote wakeup feature is also added the USB device. However, there is no additional code needed to be added in the driver to support this feature. 3.00a hvm 12/03/09 Added the modifications related to the new USB error reporting register in the XPS USB device. Updated to use HAL processor APIs. Removed _m from the name of the macros. XUsb_mReadReg is renamed to XUsb_ReadReg and XUsb_mWriteReg is renamed to XUsb_WriteReg. 3.01a hvm 5/20/10 Updated with fix for CR561171.The interrupt handler is updated to call the error handler callback function during error interrupts. 3.02a hvm 7/15/10 Added Device ID initialization in XUsb_CfgInitialize function (CR555996). 3.02a hvm 8/5/10 Updated the XUsb_EpDataRecv function to ensure that the buffer ready bit setup is now made only during non-DMA case. CR570776. 3.02a hvm 8/16/10 Updated the examples with the little endian support. 4.00a hvm 10/21/10 Added new API XUsb_DmaIntrSetHandler for setting up DMA handler. Updated the XUsb_IntrHandler function to call the DMA handler to handle DMA events. Removed DmaDone and

DmaError variables from the XUsb structure. Added two new APIs to provide access to the new ULPI PHY register. 4.01a hvm 8/23/11 Added new bit definitions for isochronous transfer bits in endpoint configuration register. Added a new API for setting these bits for a given endpoint. These bits are available only in the newer versions of the AXI USB IP. Check the IP datasheet for more details. 4.02a bss 3/04/12 Modified XCOMPONENT_IS_READY to XIL_COMPONENT_IS_READY CR 650877 4.03a bss 06/20/10 Added SIE Reset API to reset (XUsb_SieReset) the SIE state machine in xusb.c and SIE Reset Mask in xusb_l.h for CR 660602 4.04a bss 10/22/13 Added macros for HSIC PHY registers in xusb_l.h. 5.0 adk 19/12/13 Updated as per the New Tcl API's 5.1 sk 11/10/15 Used UINTPTR instead of u32 for Baseaddress CR 867425. Changed the prototype of XUsb_CfgInitialize API. 5.2 MNK 29/03/15 Added 64bit changes for ZYNQMP. ms 03/17/17 Modified text file in examples folder for doxygen generation. 5.3 asa 02/05/19 Added dependencies.props in data folder for importing examples in SDK. </pre> /

This demo does the following steps: 1. Get the shared memory device libmetal I/O region. 1. Get the TTC timer device libemtal I/O region. 2. Get IPI device libmetal I/O region and the IPI interrupt vector. 3. Register IPI interrupt handler. 6. Download throughput measurement: Start TTC RPU counter, wait for IPI kick, check if data is available, if yes, read as much data as possible from shared memory. It will iterates until 1000 packages have been received, stop TTC RPU counter and kick IPI to notify the remote. Repeat for different package size. 7. Upload throughput measurement: Start TTC RPU counter, write data to shared memory and kick IPI to notify remote. It will iterate for 1000 times, stop TTC RPU counter.

wait for APU IPI kick to know APU has finished receiving packages. Kick IPI to notify it TTC RPU conter value is ready to read. Repeat for different package size. 8. Cleanup resource: disable IPI interrupt and deregister the IPI interrupt handler. Here is the Shared memory structure of this demo: |0x0 - 0x03 | number of APU to RPU buffers available to RPU | |0x04 - 0x1FFFFF | address array for shared buffers from APU to RPU | |0x200000 - 0x200004 | number of RPU to APU buffers available to APU | |0x200004 - 0x3FFFFF | address array for shared buffers from RPU to APU | |0x400000 - 0x7FFFFF | APU to RPU buffers | |0x800000 - 0xAFFFFF | RPU to APU buffers | /

----------/ Low level disk I/O module skeleton for FatFs (C)ChaN, 2016 /

----------/ @file diskio.c This file is the glue layer between file system and driver. Description related to SD driver: Process to use file system with SD Select xilffs in SDK when creating a BSP In SDK, set "fs_interface" to 1 to select SD interface. This glue layer can currently be used only with one SD controller enabled. In order to use eMMC, in SDK set "Enable MMC" to 1. If not, SD support is enabled by default. Description: This glue layer initializes the host controller and SD

card in disk_initialize. If SD card supports it, 4-bit mode and high speed mode will be enabled. The default block size is 512 bytes. disk_read and disk_write functions are used to read and write files using ADMA2 in polled mode. The file system can be used to read from and write to an SD card that is already formatted as FATFS. <pre> MODIFICATION HISTORY: Ver Who Date Changes ----- ---- -------- 1.00a hk 10/17/13 First release 2.0 hk 02/12/14 Corrected status check in disk initialize. CR 772072. 2.1 hk 04/16/14 Move check for ExtCSD high speed bit set inside if condition for high speed support. Include xil_types.h irrespective of xsdps.h. CR 797086. 2.2 hk 07/28/14 Make changes to enable use of data cache. 3.0 sk 12/04/14 Added support for micro SD without WP/CD. CR 810655. Make changes for prototypes of disk_read and disk_write according to latest version. 12/15/14 Modified the code according to MISRAC 2012 Compliant. Updated the FatFs to R0.10b Removed alignment for local buffers as CacheInvalidate will take care of it. sg 03/03/15 Added card detection check logic 04/28/15 Card detection only in case of card detection signal 3.1 sk 06/04/15 Added support for SD1. 3.2 sk 11/24/15 Considered the slot type before checking the CD/WP pins. 3.3 sk 04/01/15 Added one second delay for checking CD pin. 3.4 sk 06/09/16 Added support for mkfs. 3.8 mj 07/31/17 Added support for RAM based FATfs. mn 12/04/17 Resolve errors in XilFFS for ARMCC compiler 3.9 mn 04/18/18 Resolve build warnings for xilffs library mn 07/06/18 Fix Cppcheck and Doxygen warnings 4.2 mn 08/16/19 Initialize Status variables with failure values mn 09/25/19 Check if the SD is powered on or not in disk_status() </pre> @note
